

FP2030 ANNUAL MEASUREMENT AND REPORTING PROCESS

Over the course of a year, Track20, FP2030 and other partners produce and publish data on the progress of the movement. The FP2030 indicator estimates are produced by the Track20 team and in-country Monitoring & Evaluation (M&E) Officers.

1 Some FP2030 indicator estimates are produced by FPET, while others come from surveys and Health Management Information Systems (HMIS). The indicators cover various dimensions of family planning, based on a results chain that covers aspects of the enabling environment for family planning, the process of delivering services, the output of those services, expected outcomes, and the impact of contraceptive use. Read more about the indicators in the [FP2030 Measurement Framework](#).

2 Consensus meetings are held in countries with Track20 M&E Officers. During consensus meetings, governments and partners review family planning data, including discussions on data quality; utilization of statistical models and other methodologies to produce estimates; and assessment of progress towards goals. FPET estimates are used for FP2030 reporting even for countries without Track20 M&E Officers. However, these estimates are not validated during a consensus meeting. FPET is available for use by all partners and can be accessed through www.track20.org.
